

## Case History 8 – PAD in Endodontics

**Dr. Tobias Wieser**

**1.** Endodontic treatment of tooth 35. Initial radiograph shows an apical radiolucency associated with the apex of the 35

**2.** Pre cementation radiograph of the gutta percha point in place. The canal has been prepared in the normal way using endodontic instruments. On completion of the mechanical cleaning of the canal PAD was carried out (60s photosensitiser contact time and 120s illumination)

**3.** Post operative radiograph 6 months later. There is evidence of early resolution of the apical radiolucency. The tooth remains symptomless
